[Monica McLemore, RN, MPH, PhD, Clinician-Scientist](). Monica McLemore is a clinician-scientist at ANSIRH. Her research interests include unintended pregnancy prevention, the efficacy and safety of nurse administered procedural sedation, tumor markers of ovarian cancer and their behavior across the menstrual cycle, the nursing role in abortion care provision and pilot testing of a doula training program as a job vocational program for previously incarcerated women. Her current work reflects her training as a public health nurse, trained in qualitative, quantitative, and molecular methods. Nursing is a dynamic and hybrid field that meets patients and their families where they are; including the context and environment where experiences of illness and or wellness occur. As a clinician scientist, she takes an ecological approach to her work meaning women are not compartmentalized beings easily reduced to individual studies of arbitrary time points associated with their biology, Dr. McLemore's own diverse clinical experiences inform and are closely aligned with her research interest and the unifying thread is this: to produce evidence to assist nurses to meet women wherever they are, specifically, by designing patient-centered studies that enhance the knowledge base of nurses who work in gynecology, sexual and reproductive health across the lifespan. Dr. McLemore has a BS in Nursing from The College of New Jersey, an MPH from San Francisco State University, and a PhD from the University of California, San Francisco School of Nursing. 415-200-6097.
